

## Install Anaconda - Windows

1. Download Anaconda:

<https://www.anaconda.com/distribution/#windows>

2. After installation, open **anaconda prompt** and type 'python'

We can write code as above (in the anaconda prompt) or run python scripts (files with .py extension) from **anaconda prompt** by typing `python file_name.py`.

Copy the below code, save it in a .py file (test\_python.py) open **anaconda prompt** (in the same directory with the file) and type `python test_python.py`.

```
import sys # import the sys library
print('my python version is {}'.format(sys.version))
s = 'Hello python!'
print(s)
```

3. Anaconda has a lot of libraries that are already installed (numpy, ski-learn, jupyter-notebook, etc.)
